

Why an iPhone Can Cause Cancer

Abstract. The article describes a compound of nidi that are united by the same cause. As is shown, this cause is the harmful emanations from smartphones of iPhone type.

Introduction

Knowing my capabilities, an elderly woman addressed me with an interesting request. Physicians diagnosed her with increased values of all cancer-specific markers, yet were unable to find any nidus that could have caused such a state of her body. To my question as to whether she was using a smartphone of iPhone type, the woman replied that she was seldom using it and that she had bought it mere four months ago. I asked this unexpected question for the reason that, even before this case, I had conducted preliminary studies of emanations from this type of smartphones. As a result of these studies, two interesting facts were established. First, a negative polarization of these emanations, meaning the malignant impact on a human body. Second, a high intensity of these emanations that exceeds emanations from the old-type cellular phones many times over. This article is dedicated to the outcomes of more detailed studies.

iPhones and human health

The above-mentioned specifics of the iPhone emanations stipulated its other negative properties as well. It mostly concerns the operating range of these emanations. As measurements of various iPhones have demonstrated, their emanations spread up to 1.5 m away in an idle mode. In an operating mode, this distance almost doubles. Consequently, not only all users of iPhones, but people within the said operating range too, can receive a full exposure dose after a given period. As we have ascertained, even prior to the nidi emerging in a human body, negative emanations from an iPhone dramatically reduce the operational efficiency of the immune system bringing it down to nearly zero. It concerns people whose initial immunity strength is not high and is the major factor of nidi emergence. It is worthy of note that most nidi caused by the effect of iPhone emanations are of a cancerous nature. This very fact manifested itself in the abovementioned woman that applied to me for help. It should be noted that in the described case, insignificant period of the smartphone's use resulted in mere earliest stages of the oncological disease development that cannot be detected by diagnostic devices.

However, it remains unclear at first glance how the illness-causing emanations of an iPhone affect the formation of cancerous nidi in the body. Studies of the composition of the said emanations showed that they contain a specter that is relevant to emanations of the oncogenic virus. With a weak immune system, these emanations can damage the body's healthy cells whose emanation frequency is in line with that of the oncogenic virus [4].

I had a chance to observe a family where the child had type 1 diabetes and the mother used an iPhone. While examining the cerebrum structures in the mother and the child, a deviant 34th chromosome was detected in the interbrain and hippocampus. As the 34th deviant chromosome occurs in all iPhone users, it can be considered the major sign of the body being affected by disease-causing emanations of this smartphone type.

It should be noted that the mother applied to me for help regarding her child's diabetes. Normally, I do not handle type 1 diabetes with standard symptoms, but if I detect a diabetes type that concerns non-standard etiology, this case may interest me as an academician. In the described case, I had a chance to observe a non-standard pattern, where the evening blood sugar level exceeded the norm by 3-4 times, while the morning level was within the normal limits. Subsequently, I established that the child was oppressed by the negative emanations from the mother's iPhone. A more in-depth examination of the child's organism showed that diabetes was only one of the manifestations of being damaged by the iPhone emanations; the main nidus was found in the central nervous system with all relevant consequences. In other words, the spinal cord and the cerebrum structure contained nidi of a cancerous nature.

The body treatment must be started with a normalization of the deviant 34th chromosome. It should be noted that in a number of cases, iPhone emanations cause an emergence of the 34th deviant chromosome in the hematopoietic system and the esophagus as well. An absence of the deviant chromosomes in the said brain structures, the hematopoietic system and the esophagus are indicative of a complete recover of the patient. However, the very first thing to do it to neutralize the harmful emanations of an iPhone, for which purpose special phone covers exist.

I also had a chance to observe a woman who stayed in an intensive-care ward for five days after a surgery. Her daughter who was using an iPhone stayed with her this whole time. Imagine my surprise when I found the 34th deviant chromosome in a number of the mother's cerebrum structures while examining her. It is an interesting fact that in most iPhone users, the 34th deviant chromosome is diagnosed primarily in the glia area. In other words, these users suffer from a cerebrum glioblastoma at various stages of the disease. It should be noted that, in addition to the nidi listed above, in a number of cases, the harmful emanations of iPhones damage the throat, thyroid gland, esophagus, liver and genitals and impair eyesight and hearing as well. The situation should be described here in more details. Your humble servant was talking over the phone with a person for one minute having been aware in advance that the correspondent was using an iPhone. After this conversation, a discovery of a pre-cancerous condition in the auditory nerve of the right ear caused no surprise but rather confirmed the supposition that a person talking on the old-type cellular phone with an iPhone user receives a certain dose of harmful emanations that enter the brain directly through the auditory passage. In such cases, the auditory nerve is the first one to be affected. It is clear that, with seldom conversations, a normal immune system will protect the auditory nerve from iPhone emanations, but frequent and prolonged conversations are capable of substantially impairing the performance of the immune system of an old-type cellular phones' user with iPhone holders. Speaking of the latter, the impact of their devices' emanations on their auditory nerve and cerebrum structures via the auditory passage will make itself felt much sooner.

All this concerns conversations. The second channel for the disease-causing iPhone emanations entering the body is the eyes that are also directly linked with the cerebrum structures. Finally, the hematopoietic system becomes irradiated when an iPhone is used in an idle mode in the men's pockets or women's handbags and when an iPhone is used as intended for working with applications.

In addition to the cases described above, there occur more complex cases that concern a simultaneous impact of various emanations. For instance, an acquaintance of mine addressed me once regarding his granddaughter's health. While examining her by the informational wave medicine method, I detected the 27th, 31st, 33rd, 34th and 35th deviant chromosomes. Judging from the aggregate deviant chromosomes, one could make an early conclusion as to the young woman having the third stage of a geopathogenic disease (the 35th deviant chromosome) and a compound of nidi caused by the malignant

iPhone emanation (the 34th deviant chromosome). A more detailed in-depth diagnostics confirmed the previous assumption and relevant clinical manifestations. For instance, in the case of a geopathogenic disease, it is an existence of a negative polarization of motor neurons in the anterior horns, which occurs when amyotrophic lateral sclerosis develops. As for the nidi caused by iPhone emanations, they coincided with the ones listed above to a point. I was not surprised when the young woman's parents informed me that physicians were unable to determine the causes of such a great number of cancerous nidi having emerged in her body. Obviously, with the described state of the body, to make it functioning in a regular way is quite a complex task. The orthodox medicine is incapable of executing it. I hope that such pathological conditions can be cured with the help of informational wave medicine.

Conclusion

As the reader understands, the humankind is about to face a great trouble unless serious measures are taken. This trouble includes sterility, if children that are affected by iPhone emanations live to a reproductive age; cerebrum cancer, liver cancer, esophagus cancer; eyes and a number of other organs that are exposed to the strongest iPhone emanation. It should also be noted that recently, the number of instances of type 1 diabetes in children caused by iPhone emanations has dramatically increased. The very difficulty of prevention of this trouble is that the classical medicine is hard to convince that conclusions we made are fully justified and that methods the therapists are equipped with cannot instantly solve the task they are facing.
